# Section 1: Introduction

### Introduction

Thank you for your expressed interest in the Primary Care Asthma Program (PCAP).

PCAP is an evidence-based program that provides a model of care to primary care health practices in Ontario. PCAP is a part of the Ministry of Health and Long-term Care's Asthma Program (AP) mandate to reduce the utilization of health care through an integrated plan including prevention, health promotion, education, management (including treatment), surveillance and research.

This program is designed to equip primary care sites to provide evidence-based respiratory care to their patients through implementation processes, program standards and respiratory resources and tools.

We hope that this program serves you well in providing the best lung health outcomes for your patient.

**Disclaimer:** The content of this guide is based on current available evidence and has been reviewed by medical experts. It is provided for informational purposes only. The views set out in this guide are those of the authors and do not necessarily reflect those of the Government of Ontario or the Ministry of Health and Long-Term Care. The information is general in nature and is not intended to be a substitute for sound clinical judgment. Seek the advice and expertise of your health care provider with any questions you may have about your health.

## **Background Summary**

The Primary Care Asthma Program (PCAP) is an evidence-based asthma program intended to provide primary care providers with decision aids to support best practice regarding asthma assessment, diagnosis and management. Its development, implementation and evaluation as a pilot program were funded through the Ontario Ministry of Health (MOH), as one of the initiatives of the Asthma Plan of Action (APA), now called the Asthma and COPD Program. The pilot for this program was evaluated through a research study led by Drs. Teresa To and Lisa Cicutto in 8 primary care sites across the province from 2002-2006.

Results of the pilot were very positive for asthma management, patient outcomes and acute care use and were sustained at 6 and 12 month intervals. There were statistically significant improvements in:

- the amount of spirometry completed almost doubled to 67.4% from 38.4% (p<0.0001)
- relative reduction of 33.7% in daytime asthma symptoms (p=0.0432)
- relative reduction of 45.2% in night time awakening symptoms (p<0.0001)
- relative reduction of 29.9% in asthma attacks (p<0.0001)
- relative reduction of 48.8 % in missed school days (p=0.0004)
- relative reduction of 50.0% in emergency department visits (p<0.0001).<sup>1</sup>

The PCAP tools are intended for use by a multi-disciplinary team and include:

- Care Maps (Asthma and COPD)
- Action Plans (Asthma and COPD)
- Decision and Management Algorithms (Asthma and COPD)
- Generic program standards

In partnership with the Lung Health Foundation, PCAP also provides COPD program resources and tools to deliver a lung health program. The PCAP tools are based on the latest Canadian Asthma and COPD Consensus Guidelines. The care map and action plan are being adapted for integration into electronic medical records (EMRs) in primary care.

The eight sites that participated in the Primary Care Asthma Pilot Project (PCAPP) include:

- Gizhewaadiziwin Health Access Centre (Fort Frances)
- Group Health Centre (Sault Ste. Marie)
- Rural Kingston Primary Care Network (Kingston and area),
- South Riverdale Community Health Centre (CHC) (Toronto East)
- Stonegate CHC (Toronto West),
- North Lanark CHC (Lanark and Renfrew counties)
- North Hamilton CHC (Hamilton)
- Somerset West CHC (Ottawa)

Background Summary Version: February 2018

<sup>&</sup>lt;sup>1</sup> T. To, L. Cicutto, N. Degani, S. McLimont, J. Beyene, Can a Community Evidence-based Asthma Care Program Improve Clinical Outcomes? A Longitudinal Study. *Med Care* 2008;46: 1257-1266

## **Background Summary**

After the pilot, PCAP was implemented in four additional locations through the following coordinating centres:

- Asthma Research Group Inc. (Windsor various locations)
- St. Joseph's Health Care (London)
- Royal Victoria Hospital (Barrie)
- Thunder Bay Regional Health Sciences Centre\* (Thunder Bay)
   \*now St. Joseph's Care Group in Thunder Bay

In addition, Kingston General Hospital, Firestone Institute for Respiratory Health and Sunset Country FHT have taken on coordination of PCAP programs in the Kingston, Hamilton and Kenora areas respectively. **There are now 12 PCAP sites funded by the MOHLTC AP in Ontario.** 

PCAP is part of Ontario's Asthma and COPD Program, an integrated strategy of thirteen initiatives based on the Canadian Asthma Consensus Guidelines<sup>2,3</sup> and the Canadian Thoracic Society Guidelines for occupational asthma.<sup>4</sup> The goal of the AP is to reduce mortality, morbidity and health care costs for children and adults with asthma through an integrated plan focused on health promotion and prevention, management and treatment and research and surveillance.

PCAP is delivered within a multi-disciplinary team of primary care providers with the leadership of a Site Coordinator and/or a Certified Respiratory Educator (CRE) who is also trained in doing Spirometry (is certified through SpiroTrec™ or is a RRT or RCPT). The Site Coordinator and/or a CRE assist with program implementation, mentoring, and education of patients and staff. The key to the success of this program is the expertise of the educator who provides current evidence-based knowledge and assists with on-site objective measurements via spirometry to facilitate accurate diagnosis and management of asthma. The program is modeled on fostering patient and family self-management.

A Provincial PCAP Coordinator was added in 2007 to maintain and enhance current MOH funded PCAP sites and non-MOH funded PCAP sites to address ongoing program integration challenges (identified through annual needs assessments) and to assist new primary care sites with implementation and integration of PCAP into their clinics. A strategic planning session was held in the fall of 2007, with key strategies including definition of the governance structure, development of a generic business case and marketing plan, and standardization of the program including the program manuals (site and spirometry). Project groups work to implement recommendations and suggestions identified by the PCAP Advisory.

# **Background Summary**

Since 2007 and the addition of the PCAP provincial coordinator, PCAP has expanded.. Expansion:

- Over 111 sites across Ontario
   (47 co-ordinating AP-funded sites: includes branches, satellites, First Nation communities, orphaned clinics, group and single physician clinics)
- Comprehensive PCAP Training Schedule for program implementation

#### Other AP initiatives related to PCAP:

- Provider Education Program (PEP)
- Asthma Action (providing patient tools and resources)
- Emergency Department Asthma Care Pathway (EDACP) for adult and pediatric population
- Asthma Surveillance and Asthma Performance Indicators (PC-API)

Background Summary Version: November 2021

# **Primary Care Asthma and COPD Program**

## **Generic Program Standards**

The following Asthma guideline-based and COPD guideline-based program standards are recommended in primary care sites implementing a Primary Care Asthma (12,13) and/or a COPD Program.

#### **Program Standards:**

 Asthma: Paediatric and adults suspected of having asthma should be assessed, diagnosed, and managed using the Asthma Care Map (ACM) for Primary Care which is based on the recommendations in the Canadian Thoracic Society (CTS) Asthma Management Continuum Respiratory Guidelines (1). The ACM will be updated to reflect changes in the CTS guidelines.

<u>COPD</u>: Adults who are suspected to have COPD should be assessed and diagnosed. Once diagnosed, clients with COPD should be managed using the COPD Care Map (CCM) for Primary Care which is based on the Canadian Thoracic Society (CTS) recommendations for the diagnosis and management of COPD (8). The CCM will be updated to reflect changes in the CTS guidelines.

- 2. There will be a plan for training and communication of the Health Care Professional (HCP) involved in PCAP to ensure that the site staff has a level of understanding of the generic program standards consistent with their roles and responsibilities.
- 3. The HCP will provide PCAP within their scope of practice as regulated in Ontario by the Regulated Health Professions Act.
- 4. All clients will be provided with a written action plan for Asthma or COPD as appropriate

#### Spirometry/Diagnosis

- 5. Spirometry\*, pre- and post-bronchodilator, in accordance with American Thoracic Society/European Respiratory Society standards (4), will be used as the primary objective measure for the diagnosis, monitoring and management of Asthma and/or COPD.
- 6. <u>Asthma:</u> If spirometry is not used for diagnosis and monitoring, a notation as to the reason why the use of an alternative method of diagnosis/monitoring should be made in the client's chart (e.g. "client cannot perform spirometry"). In the absence of objective testing (such as for children < 6 years of age, whom it is not possible to routinely assess lung function) a careful history and physical examination are used to differentiate Asthma from other causes of episodic respiratory symptoms (1,2,3).

Alternative testing consistent with CTS guidelines will be initiated at the discretion of the client's primary care provider and where resources are available. Measurements of airway hyperresponsiveness to Methacholine challenge, Peak Expiratory Flow (PEF) for clients > 6 years of age, or exercise challenge testing may be useful in diagnostic dilemmas, such as individuals with persistent asthma symptoms despite normal spirometry, and to evaluate work-related asthma (1).

<u>COPD</u>: Diligent screening for the detection of early signs of COPD is recommended to identify the early diagnosis. Who should be screened? Please refer to the Canadian Lung Health Test (8).

According to CTS guidelines, spirometry must be used to confirm the diagnosis of COPD. Post-bronchodilator, airflow obstruction must be noted - FEV1/FVC ratio < Lower Limit of Normal (LLN)\*\* (or < 0.70 if LLN is not available) (8).

7. The assessment for asthma or COPD should include the explicit ruling out of other possible diagnoses responsible for asthma or COPD-like symptoms (1,8)

#### Asthma and COPD Management/PCAP Tools and other resources

- 8. All asthma and COPD clients, together with their family/caregivers, will be active partners in the management of their disease and in the creation of an individual action plan. (1,8)
- 9. Asthma and COPD education materials provided to the client to take home will be evidence-based, consistent with the CTS guidelines, and will strive to be age, culturally appropriate and provided in a language and format understood by the client as available.
- 10. The PCAP site will use a variety of site and community resources to reinforce the program standards.
- 11. A successful asthma or COPD education program consists of a partnership between the client and the HCP regarding the goals of treatment and ongoing follow-up to achieve and maintain optimal control of the client's lung health. Follow-up should be determined by the HCP on an individual basis. The content of the education session should refer to the CTS guidelines reflected in the care maps and algorithms.
- 12. Both Asthma and COPD clients will receive smoking cessation counseling when appropriate. It is mandatory that the HCP involved with PCAP be trained in smoking cessation counseling.
- 13. The PCAP resources will aid in clinical decision-making and guide the patient towards self-management of their disease. Client assessment may occur over an average of 1-4 visits. However, some clients who have severe disease or other issues that impact on

achieving control of their asthma and/or COPD may require additional visits. The PCAP resource catalogue includes:

<u>Asthma:</u> Asthma Care Map (ACM) for Primary Care, Asthma Action Plan, and the Asthma Diagnosis and Treatment Algorithm

<u>COPD:</u> COPD Care Map (CCM) for Primary Care, COPD Action Plan, and the COPD Diagnosis and Treatment Algorithm

Note: a variety of resources will be available in addition to the stated above. Refer to <a href="http://hcp.lunghealth.ca">http://hcp.lunghealth.ca</a>

14. The HCP should explore barriers to adherence at each visit. These may include cost of drugs, timing of administration, beliefs of non-effectiveness, concerns regarding side effects, and forgetfulness. The HCP should ensure that clients comprehend the name, purpose, duration of treatment, dosing schedule and possible adverse effects of each asthma or COPD medication prescribed (1,8)

If a client is unable to purchase asthma or COPD medications and devices as prescribed by site staff due to financial burden, the staff of the site will try to assist the client to access these medications and devices through available programs (e.g. Trillium Drug Program, compassionate access programs).

\*\* Lower Limit of Normal: A statistically derived level below which a value is considered to be abnormal (10). For most biological measurements, the standard assumption is that for data with a normal distribution, values within 2 SDs of the mean value represent 95% of the population and are considered to be normal. The LLN is defined as the 5<sup>th</sup> percentile (the value that marks the lower 5% of the normal population) (11).

#### Please note:

<u>Permission & Proper acknowledgement is required in any modification of the PCAP Tools as per PCAP process.</u>

#### **Approvals:**

Approved by Design Task Force: July 11 2002

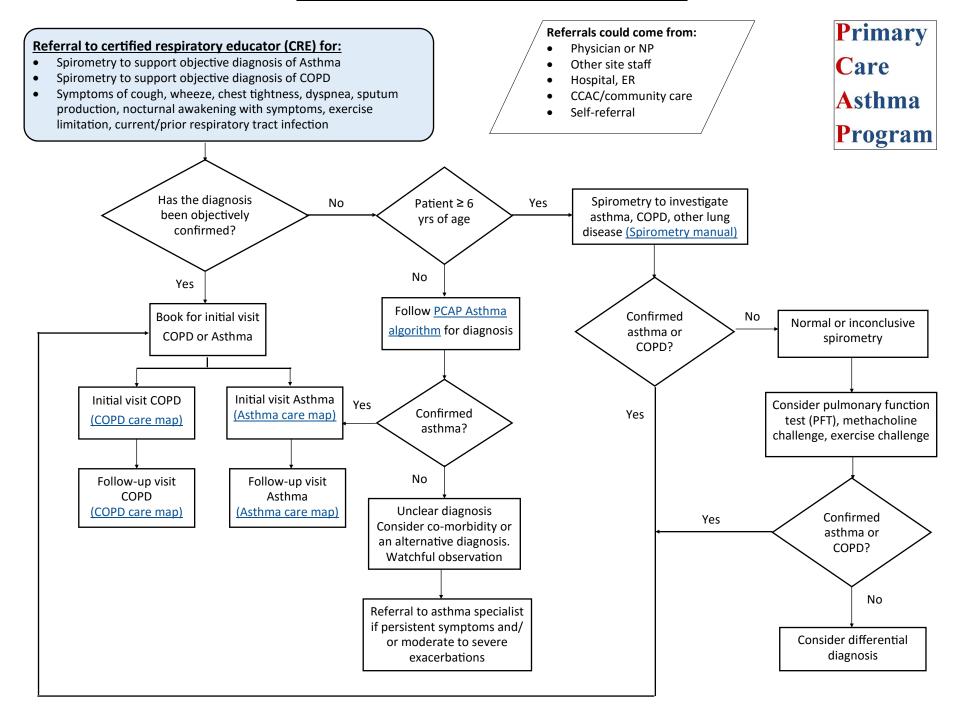

Last Amended by the Primary Care Asthma Program Advisory: June 2013

<sup>\*</sup>Spirometric values = the performance of flow-volume curves

# PRIMARY CARE ASTHMA PROGRAM EDUCATOR PRACTICE SELF-ASSESSMENT (EDUCATION)

The following tool is intended to be used by the Certified Respiratory Educator (CRE) as a self-reflective practice assessment or by a peer educator for the purpose of peer assessment for inclusion in the educator's professional portfolio. There are three components of this tool: 1. Educator's knowledge of asthma, 2. Educator's knowledge of COPD and 3. Educator's skills. This tool is not intended for rapid assessment and may require more than one session. This tool should be used to evaluate the educator's skills and abilities and be used for quality improvement. Please continue to refer to the latest CNRC learning objectives (<a href="https://www.cnrchome.net">www.cnrchome.net</a>)

Educator Principles	Competencies	Needs Improvement	Meets competency	Comments
Educator's skills in teaching	Interaction with patients in an ethical manner (beneficence, non-maleficence, autonomy, justice, confidentiality, and respect for value of others)			
	Interpersonal skills – greets, active listening, provide empathy and support			
	Information gathering skills – open vs. close-ended questions, uses silence, clarifies patient expectations, sequencing events, and summarizes information			
	Information giving skills – puts important things first, clear and simple information, repetition, problem solving skills, categorizes information			
	Conflict resolution and negotiation – reflects internally, organizes the meeting, starts on a positive note, and facilitates the heart of the meeting			
	Skills for motivating patient adherence – provides rationale for change, sets realistic and short term objectives, seeks mutual agreement, allows opportunity for rehearsal of plan, feedback, tailors the plan to the patient's lifestyle			
	Appropriate eye contact, facial expressions, proximity, handshake, posture, gesture, silence and personal mannerisms			
	Assessment patient's stage of change: pre-contemplation-contemplation-preparation-action-maintenance			

Educator Principles	Competencies	Needs Improvement	Meets competency	Comments
Educator's skills in teaching	Integration of Motivation Interviewing (MI) skills in practice			
	Identification predisposing, enabling and reinforcing factors			
	Ability to maintain objectivity			
	Provision of appropriate learning environment			
	Collaboration with the patient to assess characteristics and needs relevant to learning (health literacy, determinants of health, motivation and readiness to learn, etc.)			
	Engagement of the patient to practice mastery and promote self-efficacy			
	Linkage of the patient's new learning to existing knowledge			
	Collaboration with the client to determine health goals that are SMART (specific, measurable, achievable, relevant and timebound)			
	Integration theoretical frameworks of health promotion and care into practice (expanded chronic care model, PRECEDE/PROCEED model, social support)			
	Selection of an instructional method (e.g., questioning, role play, gaming) based on assessment results			
	Application of technology to benefit patient's learning			
	Inter-professional and inter-sectoral collaboration			
	Consideration and application of social determinants of health when teaching (cultural issues, financial barriers, lack of support, language barrier, etc.)			

Learning Objectives:		

# **Space and Design Checklist**

The following section has been developed to provide some guidance on overall design considerations, special requirements for all patients, considerations for the location, and room requirements.

#### Overall considerations for Delivering a Respiratory Program

The following design features should be considered in the planning of the Respiratory Education Centre in the primary care setting:

- Accessibility/wheelchair access/clinical setting
- Office/room well ventilated (follow requirements related to infection control practices and policies)
- Ergonomically designed environment
- Sufficient space for patient and family/caregivers. Allow for more space according to infection control practices and policies set in place
- Access to Computer/phone/fax and or space to lock/keep secure patient records
- Access to educational materials
- Efficient patient flow
- Flexibility for different activities (spirometry testing, education, smoking cessation, virtual visit)
- Multidisciplinary environment (access to referral process)
- Safe learning environment for both staff and patient
- Possible requirements for more space depending if you include a community pulmonary rehabilitation or maintenance exercise program within your primary care site
- At least another room during pandemic times to allow for settle time requirements with spirometry testing

Space and Design Version: September 2021

1

#### PCAP Chart Audit Tool

#### Introduction:

Along with government legislation in documentation of personal health records, providers are accountable to their licensing colleges as well as their employer. This chart audit tool has been designed for the respiratory educators delivering the Primary Care Asthma Program (PCAP) and outlines the minimum documentation expectations. This tool is best used in conjunction with the PCAP Best Practice Checklist. The purpose of this tool is to:

- a) Promote ongoing compliance with College documentation standards
- b) Support continuous quality improvement initiatives and should not be punitive in nature

This tool has been created as an e-fillable PDF document. In order to ensure that results are informative, please follow the instructions below:

- 1. Ensure responses are completed as posed (for example, Yes/No/not applicable) and insert any comments only within the comments section at the bottom of the page
- 2. Once chart audits are completed, results may be collated electronically or manually, and be reviewed by a peer or supervisor.

		Asthma	COPD
1	Which care map tool was used for this encounter?		

	Documentation Standards	Yes	No	Not applicable
2	The PCAP care map tool (asthma and/or COPD) is documented in the chart			
3	Each encounter with the PCAP educator is documented with the accurate date, time and location specified			
4	An order or medical directive is obtained for pre/post bronchodilator spirometry			
5	If applicable, action plan is documented with date, time, patient name and primary care provider specified			
6	All respiratory medications are clearly and accurately listed with the medication name, dose, frequency			

	and route within the patient encounter		
7	Each encounter has a reason for visit documented		
8	Each encounter has documentation of the review of possible contraindications for performing spirometry and any side effects to medication were identified (if applicable). Any patient refusals for offered services (i.e spirometry) were documented with stated reason.		
9	If spirometry was done, results were brought to the attention of the primary care provider (this could include simply stating in the documentation that Spirometry was performed and the report was provided/left for the Primary Care Provider for interpretation).		
10	Each encounter has a documented plan for the patient		
11	Each encounter with the PCAP educator is signed with credentials		
12	In your opinion, the encounter included appropriate referrals		
13	In your opinion, each encounter with the PCAP educator was documented objectively vs. subjectively*		
14	In your opinion, the encounter met the college standards which the educator belongs to		
Com	ments:	1	

### \*Examples of objective vs. subjective documentation

Objective	Subjective
"the patient was crying"	"the patient was sad"
"the patient complained of shortness of breath on exertion and was dyspneic with movement"	"the patient appeared uncomfortable"
"the treatment was not performed because" list the facts	"this treatment was not in the best interest of the patient"
"Writer informed Dr. Smith by telephone of the changes to the patient's status as charted in the flow sheet"	"The doctor is aware"

# Asthma Diagnosis and Management Algorithm for Primary Care

**Patient Presents with Asthma Symptoms** 

(cough, dyspnea, chest tightness, wheezing, sputum production, nocturna

Objectively Confirm Diagnosis: 2012 Asthma Guidelines and 2015 Preschool asthma guidelines: http://www.respiratoryguidelines.ca/

Preschoolers - Children 1-5 yrs of age (Spirometry not possible) (2)\*
Diagnosis of asthma considered in children one to five years with frequent (≥8 days/month) asthma-like symptoms or recurrent (≥2) exacerbations showing all of the following:

1. Airflow Obstruction:

ITION Obstruction:

Wheezing documented by a trained HCP using stethoscope (preferred)

Parents report 'wheezing' (alternative)

. Reversibility of airflow obstruction ) documented response to SABA (+/- oral steroids) by a trained physician or HCP during acute exacerbation

documented response to SABA (+/- oral steroids) by a trained project.

(preferred)

Parental report of symptomatic response to a 3 month therapeutic trial of medium dose ICS with SABA as needed (alternative)

3. No clinical suspicion of alternate diagnosis

Children ≥ 6 yrs to 11yrs:

1. Preferred: Spirometry showing reversible airway obstruction:

• FEV₁/FVC ratio < LLN (approx. < 0.80-0.90) based on age, sex, height and ethnicity

• And ≥12% change in FEV₁ post bronchodilator or after course of controller therapy

2. Alternative: Improvement in PEF\*\*: ≥20% post bronchodilator or after course of controller therapy (diurnal controller therapy)

variation not recommended) <mark>3. Alternative: Positive Challenge Test (if spirometry inconclusive):</mark> Methacholine challenge testing or

# Adults (≥ 12 yrs):

- 1. Preferred: Spirometry showing reversible airway obstruction:
  - FEV<sub>1</sub>/FVC ratio < LLN (approx. < 0.75-0.80) based on age, sex, height and ethnicity
  - And ≥12% and min ≥200 mL change in FEV<sub>1</sub> post bronchodilator or after course of controller therapy
- 2. Alternative: Improvement in PEF\*\*: 60L/min (min ≥20%) (post bronchodilator or after course of controller therapy) or diurnal variation >8% (based on 2 times/day reading), >20% (based on multiple daily readings)
- 3. Alternative: Positive Challenge Test (if spirometry inconclusive): Methacholine challenge testing or Exercise challenge

# **Asthma Not Confirmed**

### Consider

- Was testing done when patient was not exposed to any triggers or asymptomatic? (If yes, consider repeat testing when patient exposed/symptomatic or consider methacholine and/or exercise challenge test) or allergy testing
- Differential diagnosis: examples include COPD, CF, IPF, VCD, GERD, CHF, primary ciliary dyskinesia, infectious/allergic rhinosinusitis, upper airway narrowing, bronchiectasis, pertussis, foreign-body inhalation, aspiration, pneumonia, atelectasis, tuberculosis, eosinophilic esophagitis, immune dysfunction, swallowing problem, pulmonary edema (2)

# **Asthma Confirmed**

#### Discuss:

- History of exacerbations
- Family history of asthma/allergies
- Smoking history (and exposure to smoke)
- Respiratory medication history (check for βblocker, NSAID/ASA use, medic alert bracelet, epinephrine auto injector) and client's drug plan
- History of triggers (skin testing may be indicated)

# **Patient Assessment**

- irritant triggers (especially colds in children)
- Relevant co-morbidities (i.e., sinusitis, rhinitis, GERD, obesity)
- Work-related triggers
- Special considerations (i.e., adherence, cultural issues, financial issues, lack of support)

# Management

# Pharmacological (Baseline Maintenance Therapy):

Based on the CTS 2012 Asthma Management continuum (3) and the CTS 2015 Asthma guideline for preschoolers (2), to determine medication needed to achieve control (baseline maintenance therapy)

Adjust therapy to achieve and maintain control and prevent future risk:

- All should be on a reliever on demand: SABA\*\*\*
- Still Uncontrolled (refer to "Review Control" table): Add regular controller therapy (ICSs are the first-line controller therapy for all ages)

Children (1-5 yrs and 6-11yrs): increase low dose ICS to medium dose ICS Adults and children ≥12 yrs: add LABA if on ICS (ideally in the same inhaler device)

Still Uncontrolled:

Children (1-5 yrs): referral to asthma specialist Children (6-11yrs): add LABA or LTRA Adults and children ≥12 yrs : Add LTRA

Still Uncontrolled:

Refer to specialist, consider adding prednisone

# Non-Pharmacological (Education)

- Refer to Certified Asthma/Respiratory Educator, if available
- Discuss asthma pathophysiology, triggers, comorbidities, inhaler technique, reliever vs. controller, medication safety and side effects, adherence, asthma control
- Smoking cessation counselling when appropriate
- Create and review written ASTHMA ACTION PLAN (instruction for when there is loss of control) Note: If, after reviewing control, it is determined that the patient is uncontrolled on their baseline maintenance therapy, they are in the yellow zone and the CTS 2012 recommended controller step-up therapy should be started
- Prevention of exacerbations: environmental control (i.e. work, home and school environment), tobacco smoke exposure, environmental triggers, irritant triggers, vaccination (influenza), immunotherapy

# **Review Control**

(Reassess at each visit)

# Control indicates all of the following criteria are met

Daytime symptoms (dyspnea, cough, wheeze, chest tightness): < 4' days/week	Need for a reliever: < 4 doses/week (pre- exercise doses should be included in weekly limit)
Night time symptoms: < 1 night/week	FEV₁ or PEF: ≥ 90% of personal best
Physical activity: normal	Diurnal variability in PEF < 10%-15% over a 2 week period (readings morning and night)
Asthma exacerbations within the last 12 months: mild, infrequent	Formula = Highest PEF - Lowest PEF Highest PEF X 100
No absence from school/work due to asthma	Sputum eosinophils† < 2-3%

† Consider as an additional measure of asthma control in individuals ≥ 18 years with moderate to severe asthma who are assessed in specialized centres. ¢preschoolers with ≥8 days/month of asthma symptoms or ≥2 severe exacerbations should be considered poorly controlled and should have ICS therapy initiated

# Pharmacological (Asthma Exacerbation):

CTS 2012 recommended controller step-up therapy when patient has acute loss of control on their baseline maintenance therapy (yellow zone of ASTHMA ACTION PLAN)

# Children (1-5 yrs and 6-11yrs) Step-up

If the patient has no baseline maintenance medication: consider starting regular controller therapy If baseline maintenance medication is ICS: add prednisone 1mg/kg x 3-5 days

# Adults (≥12 years) Step-up

If the patient has no baseline maintenance medication: consider starting regular controller therapy If baseline maintenance medication is ICS: 1st choice: Trial ≥ 4-fold ↑ in ICS (dosing should not exceed manufacturer's recommended maximum daily dose) for 7-14 days. 2nd choice: Add prednisone 30-50mg for for at least 5 days

If baseline maintenance medication is ICS/LABA (BUD/FORM): 1st choice: ↑ to max 4 puffs BID for '-14 days (Max 8 puffs/day). 2nd choice: Add prednisone 30-50mg for at least 5 days

If baseline maintenance medication is ICS/LABA (FP/SALM or MOM/FORM): 1st choice: Trial ≥ 4-fold ↑ in ICS for 7-14 days. 2nd choice: Add prednisone 30-50mg for at least 5 days

Note: Post-exacerbation, diligent follow-up should be done to consider stepping down add-on therapy

# Consider Referral to a Specialist:

Not certain of diagnosis

Endorsed by:

- Sputum eosinophil monitoring
- Difficulty in determining baseline medication regimen
- Severe asthma requiring alternate therapy
- Recent ER/hospital admission or recurring exacerbations (≥2 for preschoolers [2])

\*CTS guidelines for Preschoolers (2): Please refer to latest CTS guidelines for detailed diagnosis algorithm for preschoolers \*Spirometry is the preferred method of documenting airflow limitation (12)

age and older (BUD/FORM), may be considered as a reliever for 12 years of age and older (BUD/FORM), may be considered as a reliever in individuals with mod. asthma and poor control despite fixed-dose maintenance ICS/ LABA combination or for exacerbation prone individuals with uncontrolled asthma despite high maintenance dose of ICS or ICS/LABA

\*\*\* Spirometry is the preferred objective measure to help objectively assess asthma control (9).

# Follow-Up

- Regularly reassess control (every 3-4 months for preschoolers[2]), inhaler technique, adherence, triggers, comorbidities,
- Review medication regime and consider modifying maintenance therapy (consider stepping down add-on therapy or de-
- Review/Revise written ASTHMA ACTION PLAN

\*\*\*ICS/LABA, in a formulation approved for use as a reliever for 12 years of

Appendix:

Acronym: BUD: Budesonide

**COPD:** Chronic Obstructive Pulmonary Disease

CF: Cystic Fibrosis

CHF: Congestive Heart Failure ER: Emergency room

FORM: Formoterol GERD: Gastroesophageal Reflux Disorder

HCP: Health care professional ICS: Inhaled Corticosteroid IPF: Idiopathic Pulmonary Fibrosis **LABA:** Long-Acting Beta<sub>2</sub>-Agonist LTRA: Leukotriene-Receptor Antagonist

- crease ICS dose if asthma is well-controlled between visits)

SALM: Salmeterol VCD: Vocal Cord Dysfunction

PEF: Peak Expiratory Flow

SABA: Short Acting Beta<sub>2</sub>-Agonist

MOM: Mometasone

Definitions:

FEV<sub>1</sub>: volume of air expired in the first second of the FVC (used to assess flow resistive properties of airway) FVC: Maximum volume of air that can be expired forcefully

and completely after complete inspiration FEV<sub>1</sub>/FVC: used for the assessment of airflow obstruction LLN (Lower Limit of Normal): the value below the 5th percentile for the normal population (8)

# **Pediatric** Asthma Action Plan (1-15 years)

This Asthma Action Plan outlines steps for you to self-manage asthma when you start having more symptoms. Your healthcare provider might also change your usual asthma treatment according to the level of asthma control over time. Review all symptoms and this plan regularly with your healthcare provider.

# **Asthma Triggers**

**Colds** are the most common trigger

- wash hands often

**Smoking** or being in a house or a car where someone smokes

Fumes, chemicals and strong scents

Check the Air Quality Health Index before you leave home: airhealth.ca.

# Allergies may be triggering your asthma

Follow the instructions below if you are allergic to any of these: (have allergy skin testing if you are unsure)

**Pets with fur or feathers** - If you have pets, wash them regularly and keep them out of bedrooms.

**Pollen (eg. flowers, grass, trees)** - Try to stay inside on high pollen days and avoid freshly cut grass.

**Dust and dust mites** - Wash bedsheets in hot water and vacuum with a HEPA filter or central vacuum regularly; consider mattress and pillow covers.

**Mould** - Keep bathroom and basement dry, clean visible mould, avoid decomposing leaves in the fall.

# The goal of asthma treatment is to live a healthy, active life

# Simple ways to take care of your asthma:

- Avoid triggers.
- ✓ Know your medications and how and when to take them. Take controller medications regularly.
- ✓ Follow your action plan.

✓ After any emergency room visit, schedule a follow-up appointment with your healthcare provider in the next 2 weeks.

- ✓ Always have your reliever medication with you.
- Use appropriate spacer (holding chamber) with metered dose inhaler.

# u.

# For Healthcare Providers

At every visit, re-assess adherence to therapy, inhaler technique, asthma control criteria and environmental control.

For children 1-5 years, refer to the figure provided and the 2015 Diagnosis and Management of Asthma in Preschoolers position statement\*\* to determine treatment and medication doses required to maintain ongoing asthma control. For children 6 years and over, refer to the CTS 2012 Asthma guideline update<sup>†</sup>.

An exacerbation requiring rescue systemic corticosteroids or hospitalization is an indication of suboptimal control and should prompt reassessment.

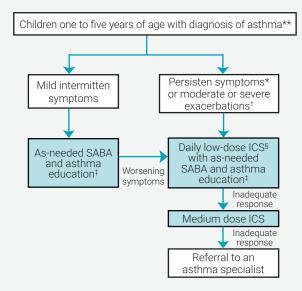

Figure 2) Treatment algorithm for preschoolers with asthma.\*Symptoms occurring  $\ge 8$  days/month,  $\ge 8$  days/month with use of inhaled short-acting  $\ge 8$ -agonists (SABA),  $\ge 1$  night awakening due to symptoms/month, any exercise limitation/month or any absence from usual activities to asthma symptoms; \*Episodes requiring rescue oral corticosteroids or hospital admission; \*Asthma education including environmental control and a written self-management plan; \*Inhaled corticosteroids (ICS) are more effective than leukotriene receptor antagonists (LTRA)

This asthma action plan was adapted from Gupta S., et al. Respiration 2012; 84(5):406-15. Pictograms in the asthma action plan were adapted from Tulloch J., et. al. Can Respir J. 2012 Jan-Feb;19(1):26-31 Instructions were designed to align with: \*\*Ducharme FM, Dell SD, Radhakrishnan D, et al. Diagnosis and management of asthma in preschoolers: A Canadian Thoracic Society and Canadian Paediatric Society position paper. Can Respir J 2015; 22(3):135-143 and †Lougheed MD, Lemiere C, Ducharme F, et al. Canadian Thoracic Society 2012 guideline update: Diagnosis and management of asthma in preschoolers, children and adults. Can Respir J 2012: Vol 19(2), 127-64.

# COPD Diagnosis and Management Algorithm for Primary Care<sup>1</sup>

#### If a patient presents with respiratory symptoms or you suspect respiratory disease ask patient about the following:

- Shortness of breath at rest or on exertion, activity limitation,
- cough,
- sputum production,
- frequent respiratory tract infections
- smoker (current or past)

# Screen smokers or ex-smokers over 40 years old who answer "YES" to any question below<sup>2</sup>:

- Do you cough regularly?
- Do you cough up phleam regularly?
- Do even simple chores make you short of breath? Do you wheeze when you exert yourself or at night?
- Do you get frequent colds that persist longer than those of other people?

# SUSPECTED

# Confirm Diagnosis with Spirometry\*

# Air flow limitation:

Post-bronchodilator FEV<sub>1</sub> / FVC < LLN or < 0.70

FEV<sub>1</sub> = forced expiratory volume in 1 second FVC = forced vital capacity LLN = Lower Limit of Normal

# **History/Risk Factors:**

- History: smoking, occupational, medical, family
- ♦ Second-hand smoke exposure
- Allergies

Assess for orthopnea

- Indoor/outdoor air pollution
- Symptoms: shortness of breath at rest or on exertion, activity limitation, cough, sputum production (amount, colour, consistency), wheezing, chest tightness

# **Physical Examination:**

- Auscultation
- Signs of lung hyperinflation, accessory muscle use
- Signs of generalized muscle wasting
- Ankle swelling (heart failure)
- Cachexia, malnutrition: body mass index [underweight < 18.5 kg/m2; overweight ≥ 25 kg/m2; obese ≥ 30 kg/m2]

\*Testing should be done when patient is stable

COPD NOT CONFIRMED

# **Differential Diagnosis**

- Asthma
- Cardiovascular or pulmonary vascular disease
- Obesity
- Severe deconditioning
- Anemia
- Interstitial lung disease Neuromuscular disease
- **Bronchiectasis**
- Tuberculosis

# **Patient Assessment & Monitoring**

Assess Severity (Refer to Pharmacological Management figure below for definitions):

# Modified Medical Research Council (mMRC) dyspnea scale:

mMRC 0: I only get breathless with strenuous exertion

mMRC 1: I get SOB when hurrying on the level or walking up a slight hill

mMRC 2: I walk slower than other people of the same age on the level, or stop for breath when walking at my own pace

mMRC 3: I stop for breath after walking 100 meters or after a few minutes

# CTS severity score (symptom burden and the risk of future exacerbations)

Mild: CAT < 10, mMRC 1, No AECOPD\*

Moderate: CAT ≥ 10, mMRC ≥ 2, Low Risk of AECOPD\*

Severe: CAT ≥ 10, mMRC ≥ 2, High Risk of AECOPD\*

\*Patients are considered at Low Risk of AECOPD with ≤ 1 moderate AECOPD in the last year (moderate AECOPD is an event with prescribed antibiotic and/or oral corticosteroids), and did not require hospital admission/ ED visit; or at High Risk of AECOPD with ≥ 2 moderate AECOPD or ≥ 1 severe exacerbation in the last year (severe AECOPD is an event

# COPD Assessment Test (CAT): www.catestonline.org

**Tests** (Do not test pulmonary function during acute exacerbation):

- Repeat spirometry as clinically indicated and additional PFTs as indicated
- CBC PRN to rule out polycythemia Consider blood gas if FEV<sub>1</sub> < 40% predicted (if resting SpO2 < 90%)
- Chest x-ray if clinically indicated Alpha-1-Antitrypsin (AAT):
  - If atypical features (early onset, family history of COPD, disabled in early 40s or 50s), send for AAT testing:

Assess for and Manage Comorbidities: heart failure, ischemic heart disease, hypertension, cancer, diabetes, sleep apnea, glaucoma/cataracts, anemia, anxiety/depression, metabolic syndrome, osteopenia, osteoporosis, peripheral muscle dysfunction, malnutrition

# **Acute Exacerbation of COPD (AECOPD):**

- Frequency, severity, purulent/non-purulent
- Hospitalizations, emergency department visits, systemic corticosteroid use
- Sputum gram stain & culture when purulent AECOPD if: very poor lung function, AECOPD ≥ 2/year, or has been on antibiotics in last 3

# **Consider Referral to Specialist**

- Not certain of the diagnosis
- Symptoms not proportional to level of airway obstruction
- Accelerated decline of lung function (FEV<sub>1</sub> declines 80 ml or more per year over a two year period)
- Symptom onset at a young age (< 40 years) Suspect alpha-1-antitrypsin deficiency
- Not responding to therapy
- Severe or recurring acute exacerbations
- Moderate to severe disease

# Non-Pharmacologic Management

#### COPD Education - provide or refer to program/Certified Respiratory **Educator (CRE):**

- Smoking cessation (<a href="https://lunghealth.ca/wp-">https://lunghealth.ca/wp-</a> content/uploads/2020/04/lhf journeytoquit digital.pdf)
- Pathophysiology and treatment rationale
- Inhaler technique (https://lunghealth.ca/lung-disease/a-to-z/asthma/howto-use-an-inhaler/)
- Self-management education with written action plan
- (https://cts-sct.ca/action-plans/)
- Identify and reduce/remove risk factors
- Acute exacerbation recognition and treatment Managing dyspnea, energy conservation
- Barriers to management or special considerations such as medication adherence, cultural barriers, financial issues, lack of support, language, nutritional assessment

# **Exercise/ Pulmonary Rehabilitation:** • Refer patients for pulmonary rehabilitation within 1 month of hospital

- discharge for acute exacerbation of COPD
- ◆ Encourage all COPD patients to be active
- ◆ Consider community-based exercise programs
- ◆ COPD patient information (<a href="https://lunghealth.ca/rwhesource-library/">https://lunghealth.ca/rwhesource-library/</a>)

# Follow-Up Care:

- ♦ Follow-up post discharge from hospital
- Schedule regular follow-up care

# **End of Life Care**

#### COPD Action Plan Instructions

The **goal of a COPD Action Plan** is to help those with COPD prevent and manage exacerbations in conjunction with the healthcare professional team (the physician\*, the certified respiratory educator and the pharmacist), i.e., **collaborative self-management**. The healthcare professional team should complete/review the following information with the patient:

- a list of persons to contact when he/she needs help
- a list of baseline symptoms and the actions to be taken to stay well (green zone)
- the symptoms indicating worsening COPD and the actions to be taken to manage the exacerbation (yellow zone)
- the symptoms which require urgent treatment (red zone)

Early and appropriate intervention may help to prevent or minimize the impact of an exacerbation.

**REMEMBER:** The **COPD Action Plan** is a tool to facilitate communication between the COPD patient and his/her healthcare professional team. Once completed, the Action Plan should be brought to **each** follow-up visit, **reviewed** regularly and modified as necessary. Follow up should include a discussion on past exacerbations and how the patient used their Action Plan and managed flare-ups.

A certified respiratory educator or other qualified member of the healthcare professional team should discuss and review the document with the COPD patient to ensure he/she:

- · has a clear understanding of how to recognize worsening COPD symptoms; and
- is confident in knowing when and what actions are to be taken based on the severity of symptoms, including when to fill the prescription for additional medications and when to seek urgent/emergent medical attention.

**CAUTION:** To be successful, the COPD patient must achieve behavioral change through collaborative self-management, although this is not without risk. Recently, it has been shown in a large clinical trial that patients engaged in a collaborative self-management program, which included the use of an Action Plan, could have unexpected negative outcomes, including increased risk of death.

# The COPD Action Plan consists of two parts:

**Part I** includes written instructions on what actions should be taken by the person with COPD based on symptoms (sputum and shortness of breath) in the green, yellow and red zones. It includes three copies, a copy for the patient, the physician and the respiratory educator. Any member of the healthcare professional team can begin the process for completing the Action Plan.

**Part II** includes a prescription for medications to be initiated in the case of sustained worsening symptoms. It is completed by a physician. It also includes three copies, a copy for the patient, the physician and the pharmacist.

**WARNING: 1)** Separate both parts of the Action Plan before completing. Since both parts are carbon copied, ensure that when part I is being completed, part II is not directly underneath, as the information will be transferred. **2)** Please ensure the physician signs the pharmacist's copy of the Action Plan. In order for the prescription to be accepted by the pharmacist, an original signature from the physician is required on the pharmacist's copy of the Action Plan.

# COPD ACTION PLAN (Patient's copy)

# Why do I need this COPD Action Plan?

- Your Action Plan is a written contract between you and your health care team. It will tell you how to manage your COPD
  flare-ups. Use it along with any other information you get from your health care team about managing your COPD every day.
- Your Action Plan will help you and your caregivers to quickly recognize and act to treat your flare-ups. This will keep your lungs and you as healthy as possible.

### How will I know that I am having a COPD "flare-up"?

- You will often see a change in your amount or colour of sputum and/or you may find that you are more short of breath than
  usual. Other symptoms can include coughing and wheezing more.
- Your flare-up Action Plan is to be used only for COPD flare-ups. Remember that there are other reasons you may get short of breath, such as when you have pneumonia, are anxious, or have heart problems.
- Before or during a flare-up you may notice changes in your mood, such as feeling down or anxious. Some people have low
  energy or feel tired before and during a COPD flare-up.

# What triggers a "COPD flare-up"?

- A COPD flare-up can sometimes happen after you get a cold or flu, or when you are stressed and run down.
- Being exposed to air pollution and changes in the weather can also cause COPD flare-ups. To learn about the daily air quality
  in your area, visit Environment Canada's Air Quality Health Index (AQHI) website at www.ec.gc.ca/cas-aqhi/ and click on 'Your
  Local AQHI Conditions'. Ask your health care team about ways to avoid all possible triggers.

# When should I use this COPD Action Plan?

- Your COPD Action Plan is used only for COPD flare-ups.
- Remember that there are other reasons you may get short of breath, such as when you have pneumonia, are anxious, or have heart problems. If you become more short of breath but don't have symptoms of COPD flare-up, see a doctor as soon as possible.

#### **REMEMBER:**

- Learn about your COPD from a respiratory educator, credible websites, such as www.lung.ca, and education programs.
- Take your regular daily medicine as prescribed.
- Don't wait more than 48 hours after the start of a COPD flare-up to take your antibiotic and/or prednisone medicines. See your pharmacist quickly to get your prescriptions for COPD flare-up.
- When you start an antibiotic, make sure that you finish the entire treatment.
- Quitting smoking and making sure that your vaccinations are up-to-date (for flu every year and for pneumonia at least once)
   will help prevent flare-ups.
- Be as active as possible. Inactivity leads to weakness, which may cause more flare-ups or flare-ups that are worse than usual.
   Ask your doctor about pulmonary rehabilitation and strategies to help reduce your shortness of breath and improve your quality of life.
- Follow up with your doctor within 2 days after using any of your prescriptions for a COPD flare-up.

Canadian Respiratory

# **COPD ACTION PLAN (Physician's copy)**

### **Pharmacological Treatment**

- 1. Short-acting (beta<sub>2</sub>-agonists and anticholinergic) bronchodilators to treat wheeze and dyspnea. Continue all of your long acting bronchodilators or inhaled steroids as prescribed.
- 2. Prednisone (oral) → 30-50 mg once daily for 5-10 days for patients with moderate to severe COPD.
- 3. Antibiotic choice is prescribed based upon the presence of risk factors as below.
- 4. Severe AECOPD complicated by acute respiratory failure is a medical emergency. Consider consultation with an emergency specialist or respirologist.

#### Antibiotic Treatment Recommendations for Acute COPD Exacerbations<sup>1, 2</sup>

Group	Probable Pathogens	First Choice	Alternatives for Treatment Failure
I, Simple Smokers FEV1 > 50% ≤ 3 exacerbations per year	H. influenzae M. catarrhalis S. pneumoniae	Amoxicillin, 2nd or 3rd generation cephalosporin, doxycycline, extended spectrum macrolide, trimethoprimsulfamethoxazole (in alphabetical order).	Fluoroquinolone β-lact/ β-lactamase inhibitor.
II, Complicated, as per I, plus at least one of the following should be present: FEV1<50% predicted; ≥4 exacerbations/ year; ischemic heart disease; use home oxygen or chronic oral steroids; antibiotic use in the past 3 months.	As in group I, plus: Klebsiella spp. and other Gram-negative bacteria Increased probability of β- lactam resistance.	Fluoroquinolone β-lact/ β-lactamase inhibitor (in order of preference).	May require parenteral therapy. Consider referral to a specialist or hospital.
III, Chronic Suppurative II, plus: Constant purulent sputum; some have bronchiectasis; FEV1 usually <35% predicted; chronic oral steroid use; multiple risk factors.	As in group II, plus: P. Aeruginosa and multi-resistant Enterobacteriaceae.	Ambulatory - tailor treatment to P. Aeruginosa is common (cipro Hospitalized - parenteral therap	ofloxacin)

# **General Recommendations for the Physician**

- Patients need to be instructed to call or visit their treating physician if symptoms persist or worsen after 48 hrs in spite of patient-initiated treatment. Please instruct patients to notify their doctor, respiratory educator, or case manager within 2 days of filling any of their prescriptions for a COPD flare-up.
- Prescriptions for antibiotics and prednisone can be refilled twice each, as needed, for 1 year. Pharmacists may fax the doctor's office after any portion of the prescriptions for COPD flare-up has been filled.
- To reduce the risk of antibiotic resistance, if more than one treatment is required over 3 months, the class of antibiotics should be changed on subsequent courses of therapy.
- Review with your patient measures to prevent future COPD exacerbations including smoking cessation, annual influenza vaccination, pneumococcal vaccination and appropriate use of inhaled daily medications.
- Consider referral to a local respiratory educator and pulmonary rehabilitation program if available.

- Consider referral to a local respiratory educator and pulmonary rehabilitation program if available.

# **COPD ACTION PLAN (Pharmacist's copy)**

### **Pharmacological Treatment**

- 1. Short-acting (beta,-agonists and anticholinergic) bronchodilators to treat wheeze and dyspnea. Continue all of your long acting bronchodilators or inhaled steroids as prescribed.
- 2. Prednisone (oral) → 30-50 mg once daily for 5-10 days for patients with moderate to severe COPD.
- Antibiotic choice is prescribed based upon the presence of risk factors as below.
- 4. Severe AECOPD complicated by acute respiratory failure is a medical emergency. Consider consultation with an emergency specialist or respirologist.

#### Antibiotic Treatment Recommendations for Acute COPD Exacerbations<sup>1,2</sup>

Group	Probable Pathogens	First Choice	Alternatives for Treatment Failure
I, Simple Smokers FEV1 > 50% ≤ 3 exacerbations per year	H. influenzae M. catarrhalis S. pneumoniae	Amoxicillin, 2nd or 3rd generation cephalosporin, doxycycline, extended spectrum macrolide, trimethoprimsulfamethoxazole (in alphabetical order).	Fluoroquinolone β-lact/ β-lactamase inhibitor
II, Complicated, as per I, plus at least one of the following should be present: FEV1<50% predicted; ≥4 exacerbations/ year; ischemic heart disease; use home oxygen or chronic oral steroids; antibiotic use in the past 3 months.	As in group I, plus: Klebsiella spp. and other Gram-negative bacteria Increased probability of β- lactam resistance.	Fluoroquinolone β-lact/ β-lactamase inhibitor (in order of preference).	May require parenteral therapy. Consider referral to a specialist or hospital.
III, Chronic Suppurative II, plus: Constant purulent sputum; some have bronchiectasis; FEV1 usually <35% predicted; chronic oral steroid use; multiple risk factors.	As in group II, plus: P. Aeruginosa and multi-resistant Enterobacteriaceae.	Ambulatory - tailor treatment to airway pathogen; P. Aeruginosa is common (ciprofloxacin) Hospitalized - parenteral therapy usually required.	

#### **General Recommendations for the Pharmacist**

- Patients need to be instructed to call or visit their treating physician if symptoms persist or worsen after 48 hrs in spite of patient-initiated treatment. Please instruct patients to notify their doctor, respiratory educator, or case manager within 2 days of filling any of their prescriptions for a COPD flare-up.
- · Prescriptions for antibiotics and prednisone can be refilled twice each, as needed, for 1 year. Even if you have any concerns to discuss with the doctor, please fill at least the minimum quantity of the appropriate prescription based on the patient's symptoms.
- To reduce the risk of antibiotic resistance, if more than one treatment is required over 3 months, the class of antibiotics should be changed on subsequent courses of therapy.
- Review with your patient some general measures to prevent future COPD exacerbations including smoking cessation, annual influenza vaccination, pneumococcal vaccination and appropriate use of inhaled daily medications.

# Box 5-2a.Usual features of asthma, COPD and asthma-COPD overlap

# Box 5-2b.Features that if present favor asthma or COPD

Feature	Asthma	COPD	Asthma-COPD overlap	More likely to be asthma if several of*	More likely to be COPD if several of*
Age of onset	Usually childhood onset but can commence at any age.	Usually > 40 years of age	Usually age ≥40 years, but may have had symptoms in childhood or early adulthood	☐ Onset before age 20 years	☐ Onset after age 40 years
Pattern of respiratory symptoms	Symptoms may vary over time (day to day, or over longer periods), often limiting activity. Often triggered by exercise, emotions including laughter, dust or exposure to allergens	Chronic usually continuous symptoms, particularly during exercise, with 'better' and 'worse' days	Respiratory symptoms including exertional dyspnea are persistent but variability may be prominent	<ul> <li>Variation in symptoms over minutes, hours or days</li> <li>Symptoms worse during the night or early morning</li> <li>Symptoms triggered by exercise, emotions including laughter, dust or exposure to allergens</li> </ul>	<ul> <li>□ Persistence of symptoms despite treatment</li> <li>□ Good and bad days but always daily symptoms and exertional dyspnea</li> <li>□ Chronic cough and sputum preceded onset of dyspnea, unrelated to triggers</li> </ul>
Lung function	Current and/or historical variable airflow limitation, e.g. BD reversibility, AHR	$FEV_1$ may be improved by therapy, but post-BD $FEV_1/FVC < 0.7$ persists	Airflow limitation not fully reversible, but often with current or historical variability	Record of variable airflow limitation (spirometry, peak flow)	☐ Record of persistent airflow limitation (post-bronchodilator FEV <sub>1</sub> /FVC < 0.7)
Lung function between symptoms	May be normal between symptoms	Persistent airflow limitation	Persistent airflow limitation	☐ Lung function normal between symptoms	☐ Lung function abnormal between symptoms
Past history or family history	Many patients have allergies and a personal history of asthma in childhood, and/or family history of asthma	History of exposure to noxious particles and gases (mainly tobacco smoking and biomass fuels)	Frequently a history of doctor- diagnosed asthma (current or previous), allergies and a family history of asthma, and/or a history of noxious exposures	<ul> <li>Previous doctor diagnosis of asthma</li> <li>Family history of asthma, and other allergic conditions (allergic rhinitis or eczema)</li> </ul>	<ul> <li>□ Previous doctor diagnosis of COPD, chronic bronchitis or emphysema</li> <li>□ Heavy exposure to a risk factor: tobacco smoke, biomass fuels</li> </ul>
Time course	Often improves spontaneously or with treatment, but may result in fixed airflow limitation	Generally, slowly progressive over years despite treatment	Symptoms are partly but significantly reduced by treatment. Progression is usual and treatment needs are high	<ul> <li>□ No worsening of symptoms over time. Symptoms vary either seasonally, or from year to year</li> <li>□ May improve spontaneously or have an immediate response to BD or to ICS over weeks</li> </ul>	☐ Symptoms slowly worsening over time (progressive course over years) ☐ Rapid-acting bronchodilator treatment provides only limited relief.
Chest X-ray	Usually normal	Severe hyperinflation & other changes of COPD	Similar to COPD	□ Normal	☐ Severe hyperinflation
Exacerbations	Exacerbations occur, but the risk of exacerbations can be considerably reduced by treatment	Exacerbations can be reduced by treatment. If present, comorbidities contribute to impairment	Exacerbations may be more common than in COPD but are reduced by treatment. Comorbidities can contribute to impairment	*Syndromic diagnosis of airways disease: how to use Box 5-2b Shaded columns list features that, when present, best identify patients with typical asthma and COPD. For a patient, count the number of check boxes in each column. If three or more boxes are checked for either asthma or COPD, the patient is likely to have that disease. If there are similar numbers of checked boxes in each column, the diagnosis of ACO should be considered. See Step 2 for more details.	
Airway inflammation	Eosinophils and/or neutrophils	Neutrophils ± eosinophils in sputum, lymphocytes in airways, may have systemic inflammation	Eosinophils and/or neutrophils in sputum.
