COPD Diagnosis & Management Algorithm

FOR PRIMARY CARE

If a patient presents with respiratory symptoms or you suspect respiratory disease

Ask patient about the following:

- Shortness of breath at rest or on exertion
- Activity limitation
- Cough

- Sputum production
- Frequent respiratory tract infections
- Smoker (current or past)

Screen smokers or ex-smokers over 40 years old who answer "YES" to any question below2

Do you cough regularly?

COPD NOT CONFIRMED

- Do you cough up phlegm regularly?
- Do even simple chores make you short of breath?
- Do you wheeze when you exert yourself or at night?
- Do you get frequent colds that persist longer than those of other people?

COPD SUSPECTED

CONFIRM DIAGNOSIS WITH SPIROMETRY*

Air flow limitation

- Post-bronchodilator FEV₁ / FVC < LLN or < 0.70
 - FVC = forced vital capacity
- FEV₁ = forced expiratory volume in 1 second
- LLN = Lower Limit of Normal

History/Risk Factors

- History: smoking, occupational, medical, family
- · Second-hand smoke exposure
- Assess for orthopnea
- Allergies
 - · Indoor/outdoor air pollution
- Symptoms: shortness of breath at rest sputum production (amount, colour, consistency), wheezing, chest tightness
- Ankle swelling (heart failure)
- Cachexia, malnutrition: body mass index [underweight
- < 18.5 kg/m2; overweight $\ge 25 \text{ kg/m2}$; obese $\ge 30 \text{ kg/m2}$]

or on exertion, activity limitation, cough,

DIFFERENTIAL DIAGNOSIS

- Asthma
- Cardiovascular or pulmonary vascular disease
- · Obesity
- · Severe deconditioning
- Anemia
- Interstitial lung disease
- Neuromuscular disease
- · Bronchiectasis
- · Tuberculosis

Physical Examination

- Signs of lung hyperinflation, accessory muscle use
- · Signs of generalized muscle wasting
- *Testing should be done when patient is stable

PATIENT ASSESSMENT & MONITORING

Assess Severity (Refer to Pharmacologocal Management figure below for definitions):

Modified Medical Research Council (mMRC) dyspnea scale:

- mMRC 0: I only get breathless with strenuous exertion
- mMRC 1: I get SOB when hurrying on the level or walking up a slight hill.
- mMRC 2: I walk slower than other people of the same age on the level, or stop for breath when walking at my own pace. **mMRC 3:** I stop for breath after walking 100 meters or after a few minutes.

CTS severity score (symptom burden and the risk of future exacerbations):

Mild: CAT < 10, mMRC 1, No AECOPD*

Moderate: CAT \geq 10, mMRC \geq 2, Low Risk of AECOPD*

Severe: CAT \geq 10, mMRC \geq 2, High Risk of AECOPD*

*Patients are considered at **Low Risk of AECOPD** with ≤ 1 moderate AECOPD in the last year (moderate AECOPD is an event with prescribed antibiotic and/or oral corticosteroids), and did not require hospital admission/ ED visit; or at **High Risk of AECOPD** with ≥ 2 moderate AECOPD or ≥ 1 severe exacerbation in the last year (severe AECOPD is an event requiring hospitalization or ED visit).

COPD Assessment Test (CAT) catestonline.org

Tests (do not test pulmonary function during acute exacerbation):

- Repeat spirometry as clinically indicated and additional PFTs as indicated
- CBC PRN to rule out polycythemia
- Consider blood gas if FEV1 < 40% predicted (if resting SpO2 < 90%)
- · Chest x-ray if clinically indicated
- Alpha 1-Antitrypsin (AAT):
 - If atypical features (early onset, family history of COPD, disabled in early 40s or 50s), send for AAT testing

Assess for and Manage Comorbidities:

· heart failure

hypertension

· cancer

ischemic heart disease

- cancer
- diabetes

sleep apnea

- anemia anxiety/depression
- osteoporosis · peripheral muscle dysfunction
- metabolic syndrome malnutrition
- glaucoma/cataracts
 osteopenia

Acute Exacerbation of COPD (AECOPD):

- Frequency, severity, purulent/non-purulent
- · Hospitalizations, emergency department visits, systemic corticosteroid use
- Sputum gram stain & culture when purulent AECOPD if: very poor lung function, AECOPD ≥ 2/year, or has been on antibiotics in last 3 months

CONSIDER REFERRAL TO A SPECIALIST

- · Not certain of the diagnosis
- Symptoms not proportional to level of airway obstruction
- Accelerated decline of lung function (FEV1 declines 80ml or more per year over a two year period)
- Symptom onset at a young age (< 40 years)
- Suspect alpha-1-antitrypsin deficiency
- · Not responding to therapy
- Severe or recurring acute exacerbations
- · Moderate to severe disease

NON-PHARMACOLOGIC MANAGEMENT

COPD Education - provide or refer to program/Certified **Respiratory Educator (CRE):**

- Smoking cessation Journey to Quit
- Pathophysiology and treatment rationale
- Inhaler technique
- Self-management education with written action plan cts-sct.ca/action-plans Identify and reduce/remove risk factors
- Acute exacerbation recognition and treatment
- Managing dyspnea, energy conservation
- Barriers to management or special considerations such as medication adherence, cultural barriers, financial issues, lack of support, language,

Exercise/ Pulmonary Rehabilitation:

- Refer patients for pulmonary rehabilitation within 1 month of hospital
- discharge for acute exacerbation of COPD Encourage all COPD patients to be active
- Consider community-based or virtual at-home exercise programs COPD patient information - https://lunghealth.ca/lung-disease/a-to-z/copd
- · Follow-up post discharge from hospital

· Schedule regular follow-up care **Pulmonary**

Influenza (annually) & Pneumococcal Vaccinations - NACI Statements and Publications

Long-Term Oxygen Therapy

Can improve survival and function in appropriately chosen, stable COPD patients with chronic hypoxemia (PaO2 of 55 mm Hg or lower), or when PaO2 is less than 60 mm Hg in the presence of bilateral ankle edema, right heart failure or hematocrit > 56%.

Acute Exacerbation of COPD Treatment:

- Oral/parenteral steroids (moderate severe AECOPD)
- Antibiotics in patients with purulent exacerbations Increased short-acting bronchodilator (SABD) Oxygen therapy to maintain oxygen saturation at 88% - 92%
